

The Challenge

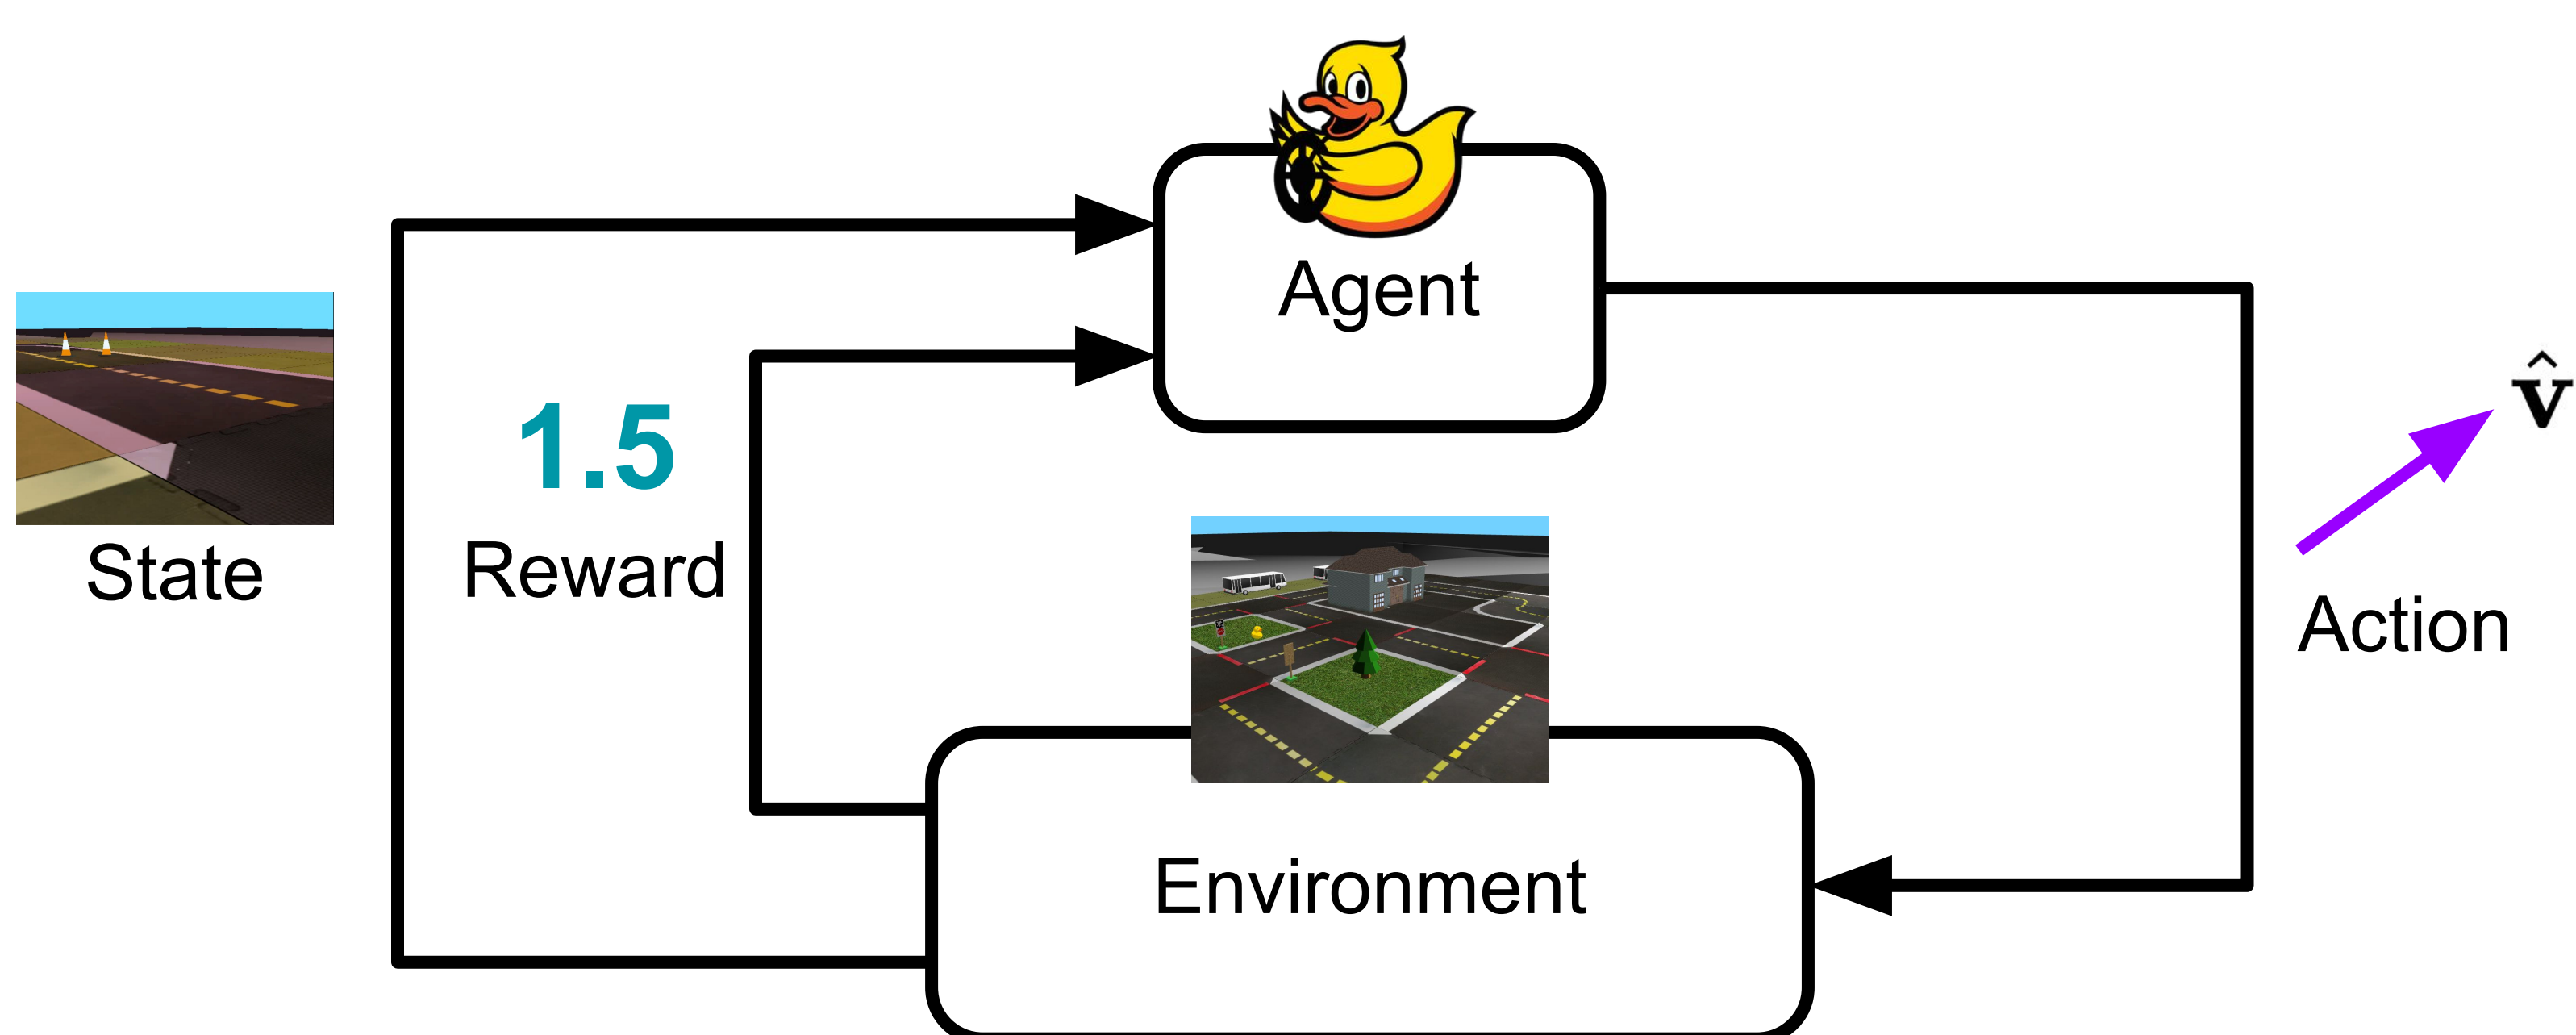

Train a virtual autonomous vehicle

Deploy in robotic environment

Reinforcement Learning (RL)

Applications

Autonomous Driving

Game Playing

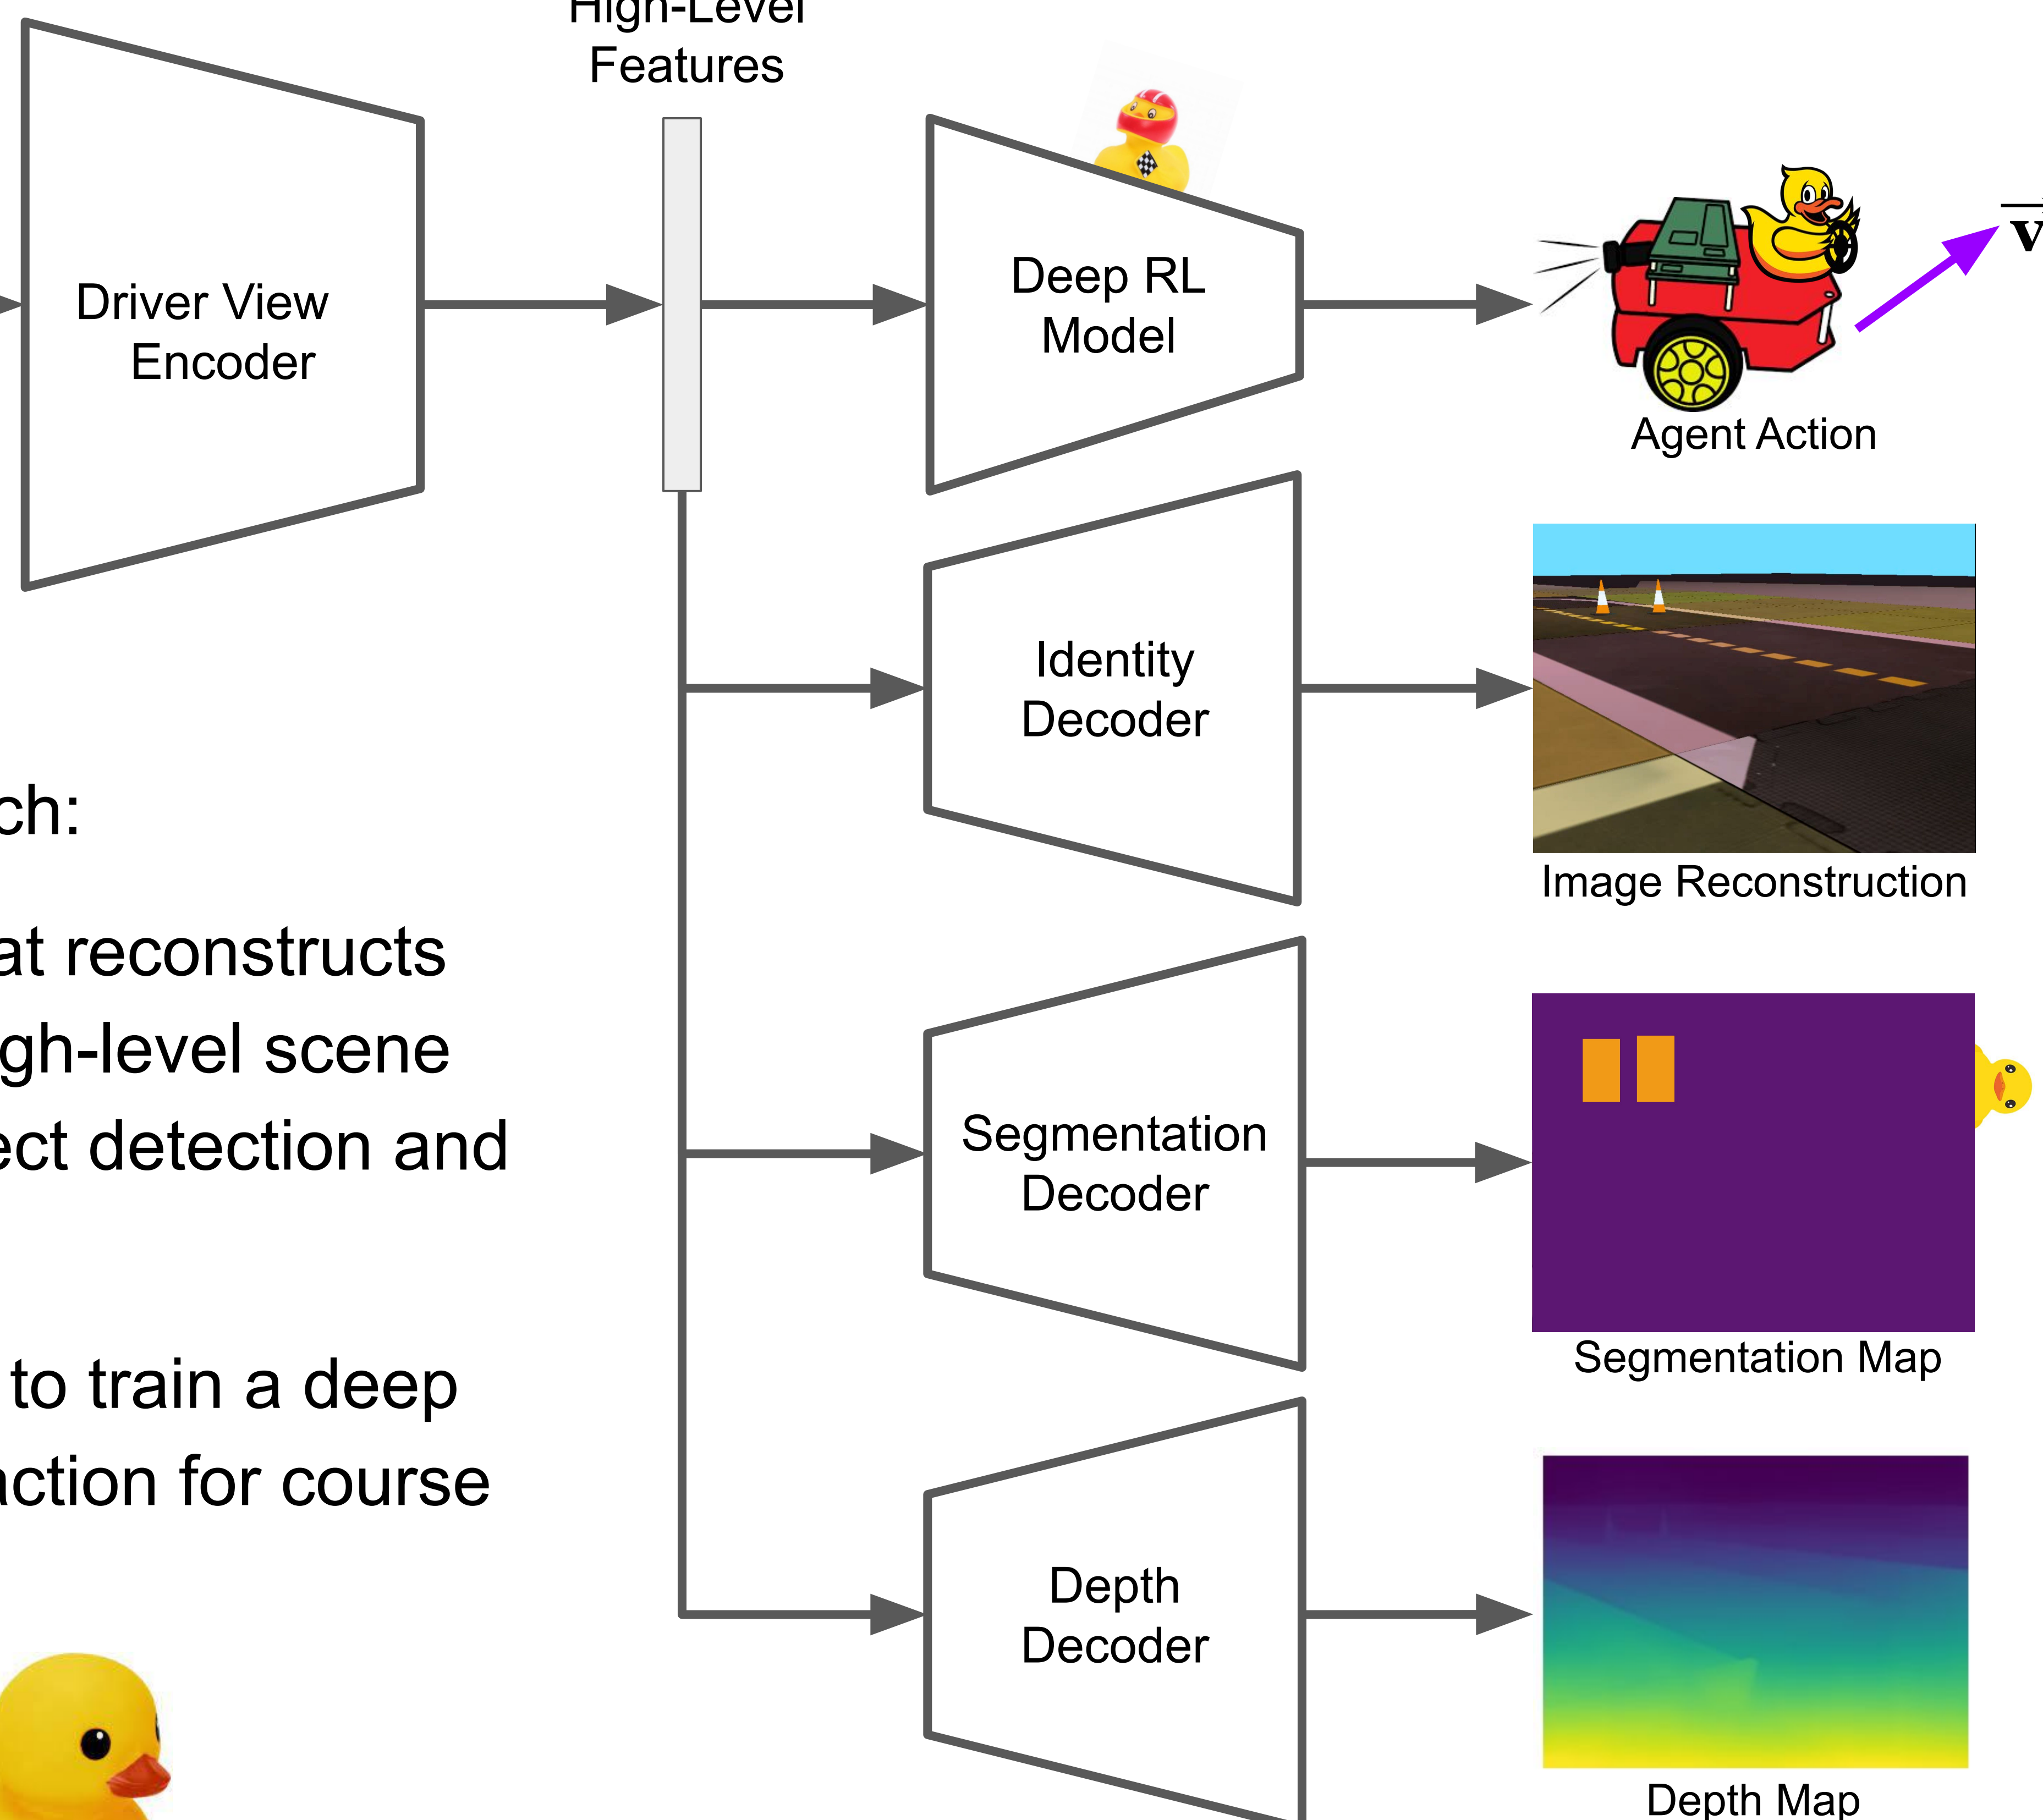

Robotic Navigation

Model Architecture

A Virtual Duckietown Driver View

We present a two-step approach:

1. Pretrain an autoencoder that reconstructs the driver view input with high-level scene understanding such as object detection and depth estimation.
2. Use the high-level features to train a deep RL model to take the best action for course navigation.
